

1 Abstract:

2 A method of providing medical treatment in which a patient is received in an emergency
3 situation and is properly diagnosed. Diagnosis includes: taking a medical history of the patient;
4 conducting a physical examination of the patient; and, if necessary, performing tests on the
5 patient. All of the diagnosis is digitally stored and is made accessible to the primary care
6 physician and also to a receiving hospital or long-care facility. The patient is not kept at the
7 invention's facility for more than twenty-four hours.
